↑ incorporating

dual linkages

E-linkages: linkages through the production and transaction of (traditional) goods and services (the New Economic Geography)

K-linkages: linkages through the creation and transfer of knowledge · ideas · information

weak microfoundation

Today's my presentation

a simple model of **knowledge interactions**

(=human interactions for the creation and transfer / learning of knowledge)

preliminary implications for
travel behavior in knowledge interactions

future research tasks

Knowledge interactions

human interactions for creation and transfer / learning of knowledge

fundamental characteristics

1. The basic unit = the **Brain** of each person
(Brain the **State of Knowledge** of a person)
2. **Heterogeneity of Brains** (= **Diversity** of People)
necessity / motivation of interactions
synergy through interactions
3. Heterogeneity is **endogenous**: It necessarily changes through interactions.

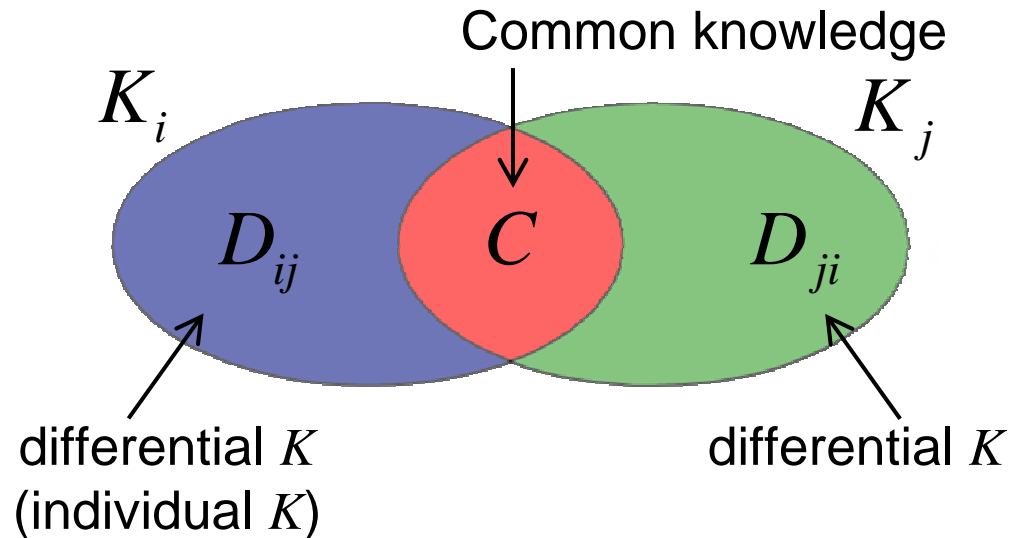

“The Bad News: The brain is the only natural resource in the Øresund Region.
The Good News: The brain is the only natural resource that expands with use.”

Håkan Pettersson
Ph.D Biochemistry, Lund

in the cooperative process of K -creation
the key factor:

the heterogeneity of people

new ideas through the encounter of heterogeneous people

“Heterogeneity is a tonic: it adds an energy of unexpected combinations.”

Joe Klein

The Guardian, June 12, 2002

“How the Solidarity dream turned sour”

“三个臭皮匠、
抵个诸葛亮”

“三人寄れば、文殊の知恵”

With three ordinary persons together,
splendid ideas will come out.

But,

Question: Is it true in the long-run?

antinomy

“With three ordinary persons together,
splendid ideas will come out.”

But, after three ordinary persons meeting for
three years, no splendid ideas will come out.

“Heterogeneity is a tonic: it adds an energy
of unexpected combinations.” (Joe Klein)

But, after three glasses of tonic, it will taste
just like plain water.

close cooperation of
heterogeneous *K*-workers

antinomy

in the short-run

through
close communications
synergy ↑

in the long-run

Common knowledge ↑
→ heterogeneity ↓
→ synergy ↓

heterogeneity of *K*-workers = an endogenous variable
changing over time

e.g. “nominication” in Japan

In the rest of presentation

A simple model of knowledge interactions
(without explicitly considering “space”)

introducing
location / distance

implications for travel behavior

Marcus Berliant and Masahisa Fujita, 4 June 2006

1. “Knowledge Creation as a Square Dance on the Hilbert Cube”
 - *N*-person case without *K*-transfer
2. “Dynamics of Knowledge Creation and Transfer: The Two Person Case”
 - 2-person case
 - both $\left\{ \begin{array}{l} K\text{-creation} \\ K\text{-transfer} \end{array} \right.$

modeling the **dynamic process of knowledge creation** as a square dance on the Hilbert Cube

- How does the **heterogeneity** (among the given set of members) **change over** time?
- How is the **productivity** in knowledge creation **affected**?

“Square Dance”

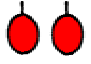

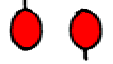

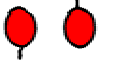

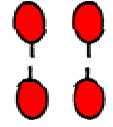

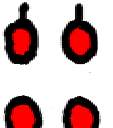

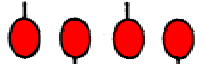

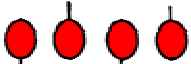

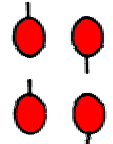

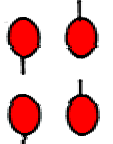

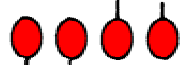

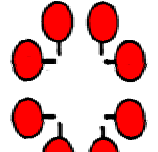

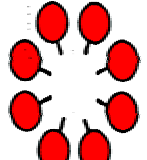

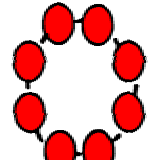

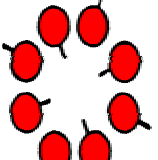

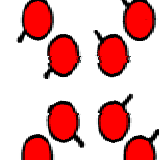

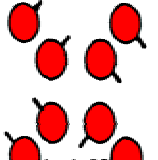

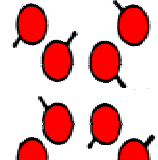

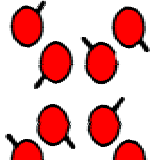

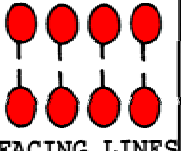

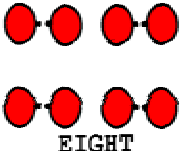

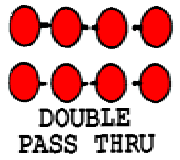

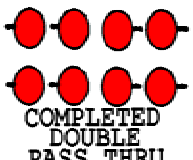

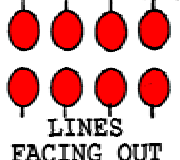

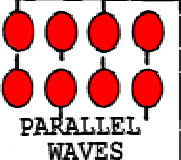

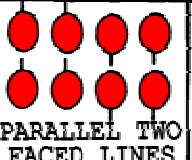

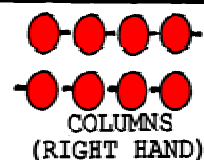

- very popular in the mid USA
- 8 members
 - each pair: partner dancing
 - sequentially changing partners

FORMATION

Names & Pictograms of selected formation arrangements (callerab 1980)

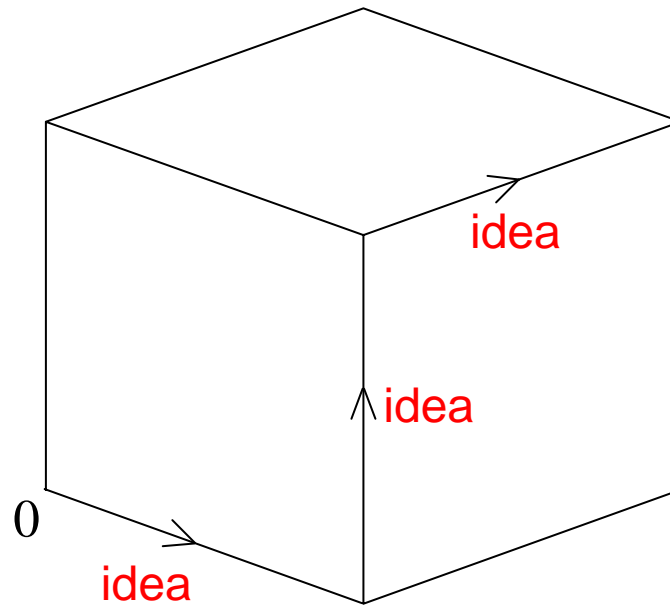

CALLERLAB

CALLERLAB APPROVED 1980

 COUPLE 1	 FACING COUPLE	 BACK TO BACK DANCERS	 MINI-WAVE (RIGHT HAND)	 MINI-WAVE (LEFT HAND)	 FACING COUPLES 6
 BACK TO BACK COUPLES	 OCEAN WAVE (RIGHT HAND)	 OCEAN WAVE (LEFT HAND)	 Right Hand Box Circulate 10	 LEFT HAND BOX CIRCULATE	 TWO FACED LINE (RIGHT HAND) 2
 TWO FACE LINE (LEFT HAND)	 STATIC SQUARE	 CIRCLE	 SINGLE FILE PROMENADE	 ALAMO STYLE	 PROMENADE
 WRONG WAY PROMENADE	 THAR STAR	 WRONG WAY THAR	 FACING LINES	 EIGHT CHAIN THRU	 TRADE BY
 DOUBLE PASS THRU	 COMPLETED DOUBLE PASS THRU	 LINES FACING OUT	 PARALLEL WAVES	 PARALLEL TWO FACED LINES	 COLUMNS (RIGHT HAND)

“Hilbert Cube” (infinite dimensional)

$n = 3$: (the cube in the three-dimensional space)

$n = 4$

$n = 5$

\vdots

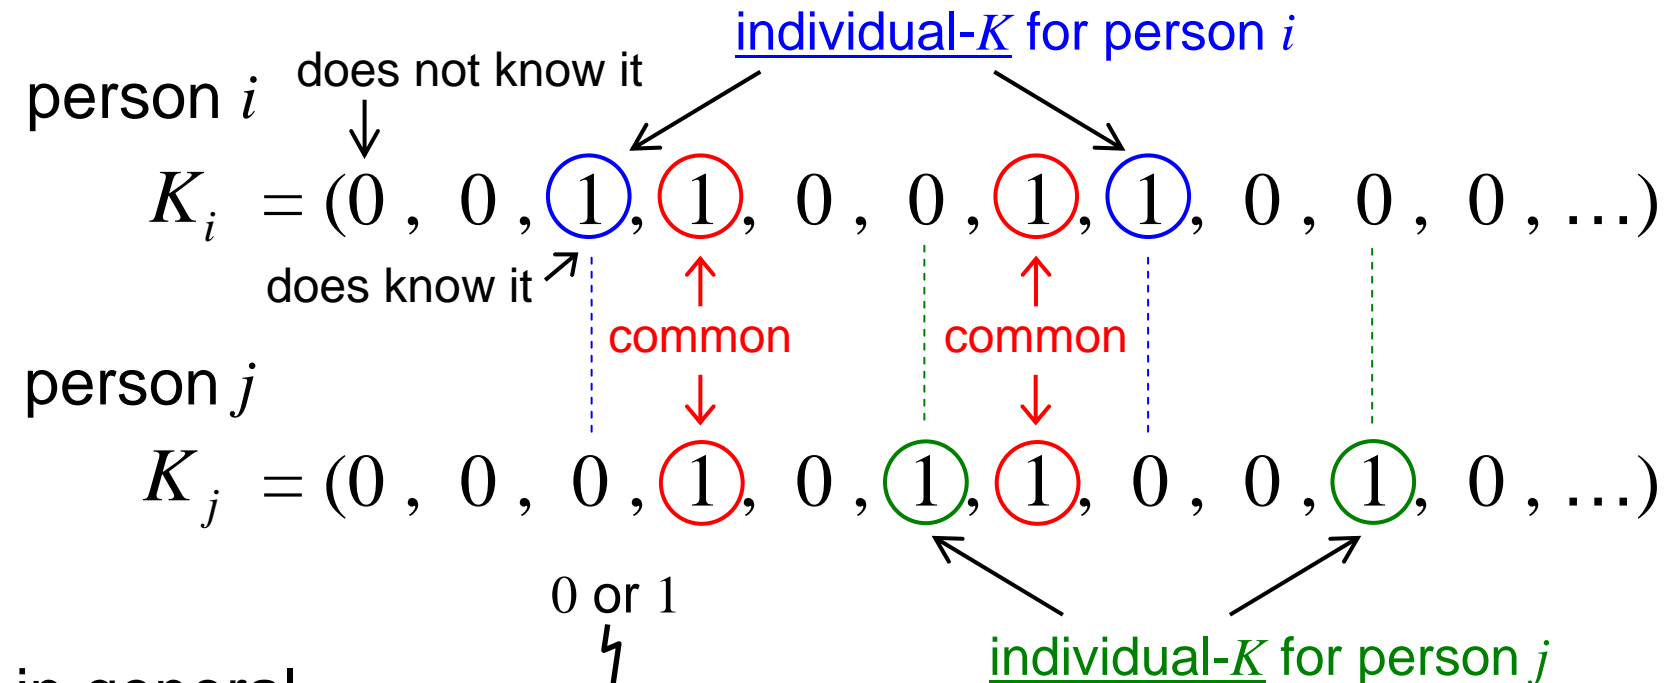

$n = \infty$: the (infinite dimensional) Hilbert space

new ideas are limitless

potential ideas : 1,2,3,...k,.....∞

sate of knowledge (at a given moment of time)

in general

$$K_i = (x_i^1, x_i^2, x_i^3, \dots, x_i^k, \dots)$$

$$K_j = (x_j^1, x_j^2, x_j^3, \dots, x_j^k, \dots)$$

over time, each K_j changes through some
creation / transfer of ideas: $x_i^k : 0 \rightarrow 1$

At each moment of time,
Knowledge creation can take place

either { in meeting of two persons
 or ↑
 only 2 at a time
 in isolation

chosen voluntarily by each person so as to:

$$\begin{array}{l} \text{max } \dot{y}_i(t) = \dot{n}_i(t) = \text{new ideas created at } t \\ \text{growth rate of } i\text{'s income} \qquad \qquad \qquad + \\ \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \text{ideas transferred from others at } t \end{array}$$

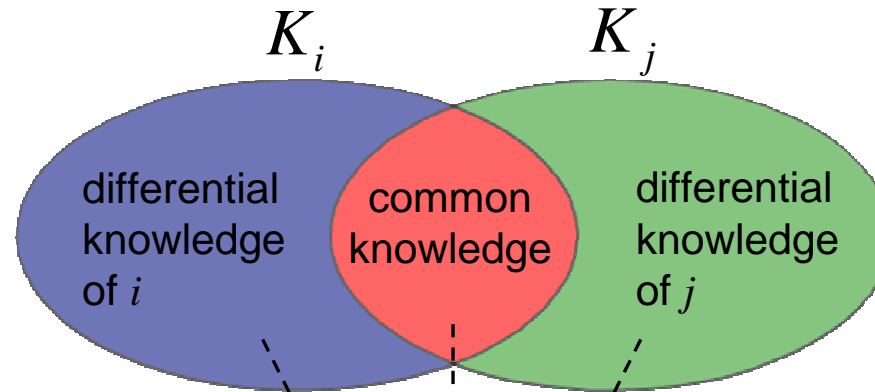

{ income of person i at time t :

$$\left\{ \begin{array}{l} y_i(t) = n_i(t) \end{array} \right.$$

↑
 the size of $K_i(t) \equiv$ the level of H -capital

in meeting of two persons, i and j

Creation and transfer of knowledge / ideas

K -creation

$$a_{ij} = \beta [n_{ij}^d \cdot n_{ij}^c \cdot n_{ji}^d]^{1/3}$$

K -transfer

$$i \rightarrow j: b_{ij} = \gamma [n_{ij}^d \cdot n_{ij}^c]^{1/2}$$

$$j \rightarrow i: b_{ji} = \gamma [n_{ij}^c \cdot n_{ji}^d]^{1/2}$$

in isolation

K -creation

$$a_i = n_i$$

the rate of growth of K_i in isolation

Index for meeting / not meeting

at each time t :

$$\delta_{ij}(t) = \begin{cases} 1 & \text{if person } i \text{ wants to meet person } j \\ 0 & \text{otherwise} \end{cases}$$

$$\delta_{ji}(t) = \begin{cases} 1 & \text{if person } j \text{ wants to meet person } i \\ 0 & \text{otherwise} \end{cases}$$

when the meeting of i and j occurs at time t ,

$$\delta_{ij}(t) = \delta_{ji}(t) = 1$$

When does the meeting by i and j take place?

$$n^{ij} = n_{ij}^d + n_{ij}^c + n_{ji}^d$$

$$m_{ij}^d = \frac{n_{ij}^d}{n^{ij}}$$

$$m_{ij}^c = \frac{n_{ij}^c}{n^{ij}}$$

$$m_{ji}^d = \frac{n_{ji}^d}{n^{ji}}$$

differential K of person i →

$m_{ij}^c = 0$: no common knowledge

Meeting Set M : $\delta_{ij} = \delta_{ji} = 1$

$$\frac{\dot{y}_i}{y_i} = \frac{\dot{n}_i}{n_i} > \alpha,$$

$$\frac{\dot{y}_j}{y_j} = \frac{\dot{n}_j}{n_j} > \alpha$$

$m_{ji}^d = 0$ →
no differential- K
possessed by j

1

0

1

$m_{ij}^d = 0$: no differential- K
possessed by i

← differential K of person j

dynamics

each in isolation

in meeting

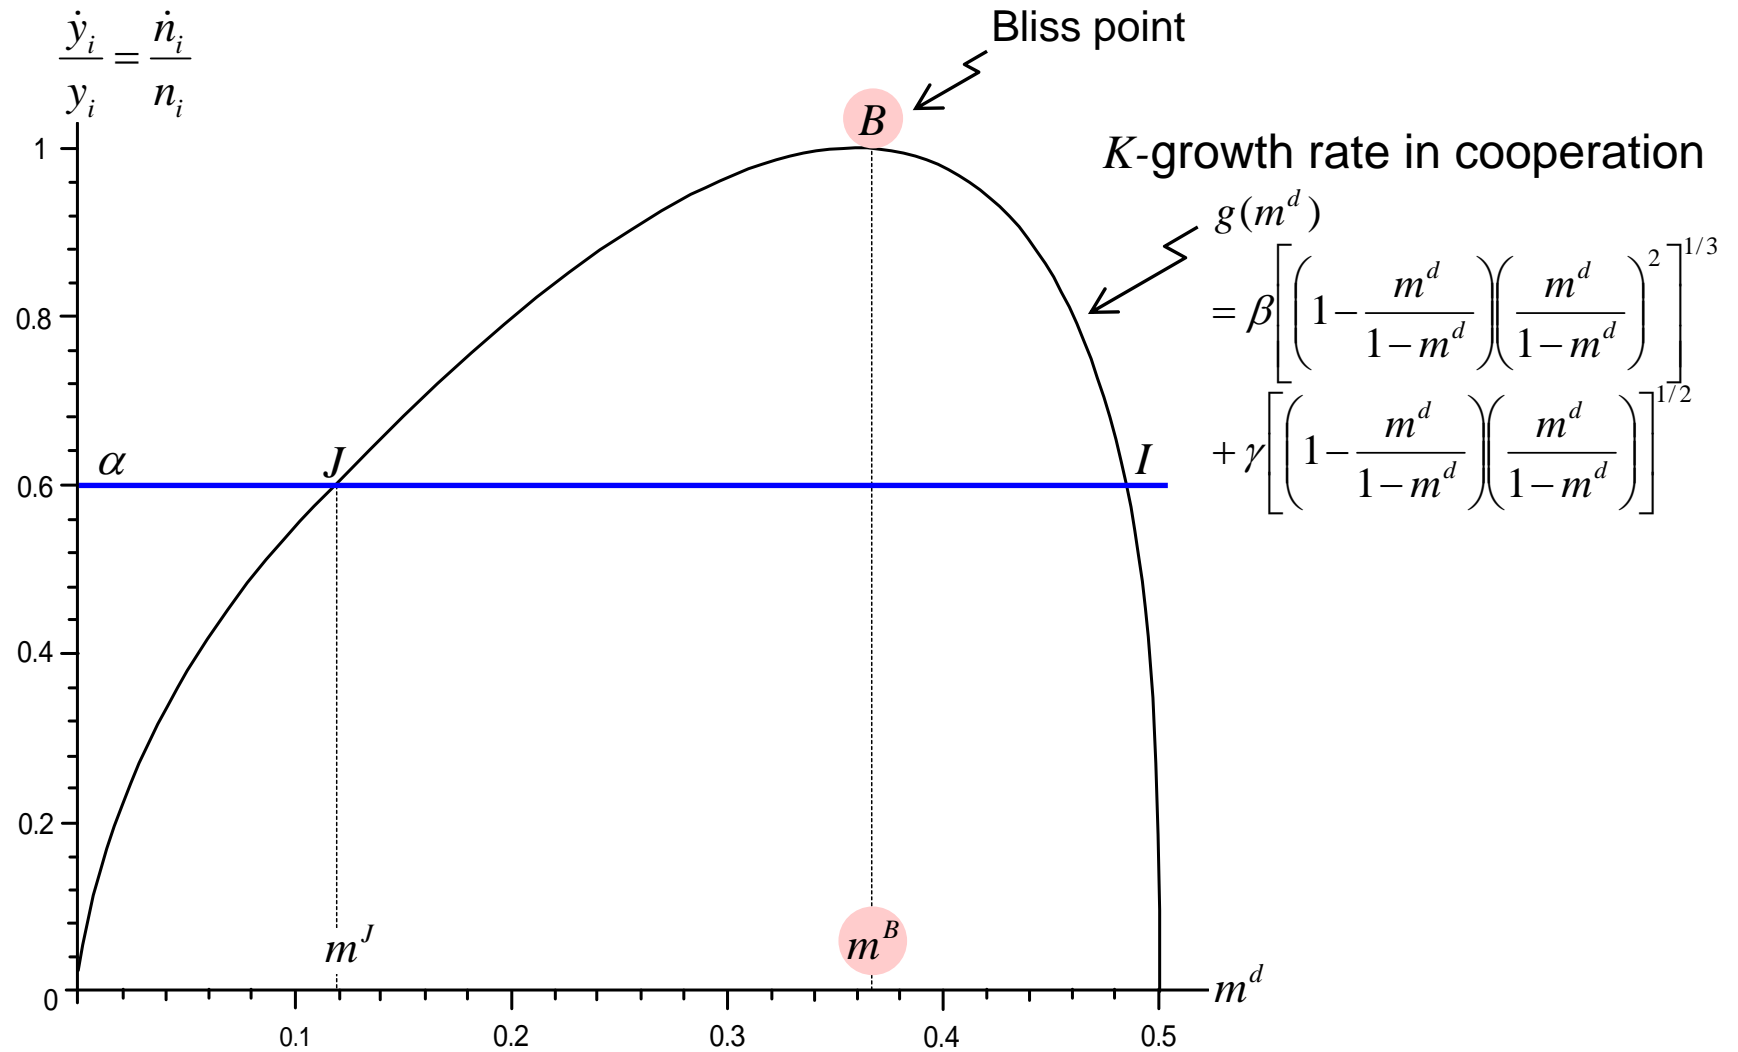

Knowledge dynamics with
endogenous

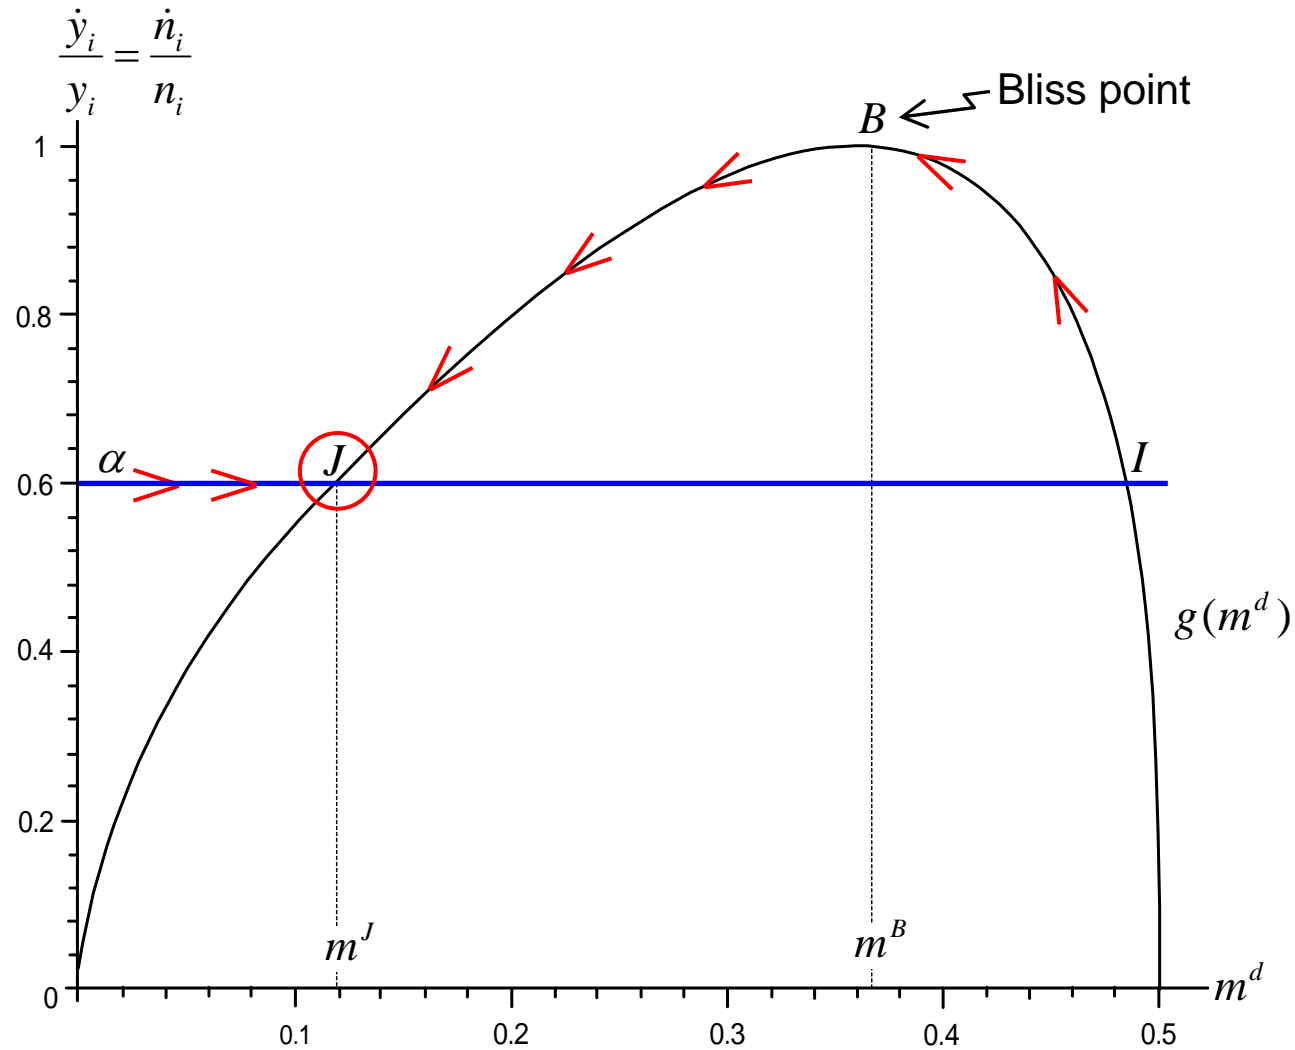

Efficiency and the bliss point on the diagonal

(symmetric case: $m_{ij}^d = m_{ji}^d \equiv m^d$)

equilibrium dynamics on the diagonal

the 2-person case

The two-person case

tendency for the accumulation of too much common knowledge

the 4-person case

possible equilibrium configurations
with four dancers

(a) solos

(b - 1)

(b - 2)

(b - 3)

(c - 1)

(c - 2)

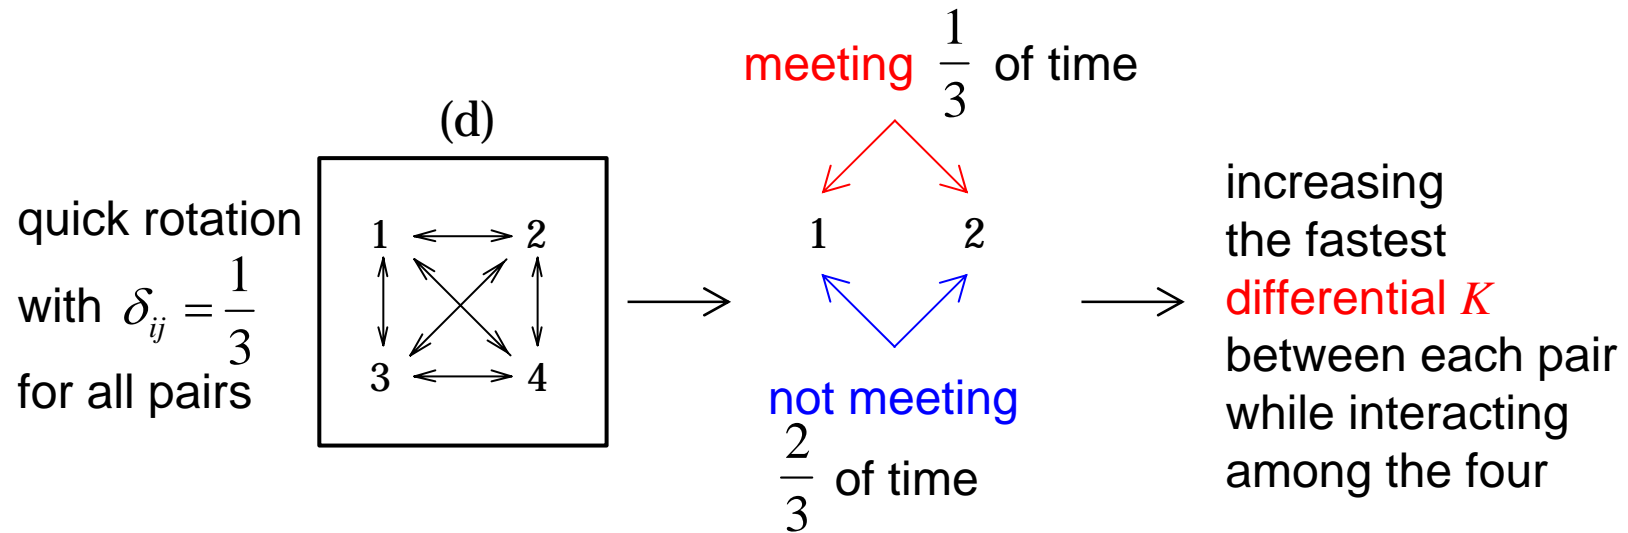

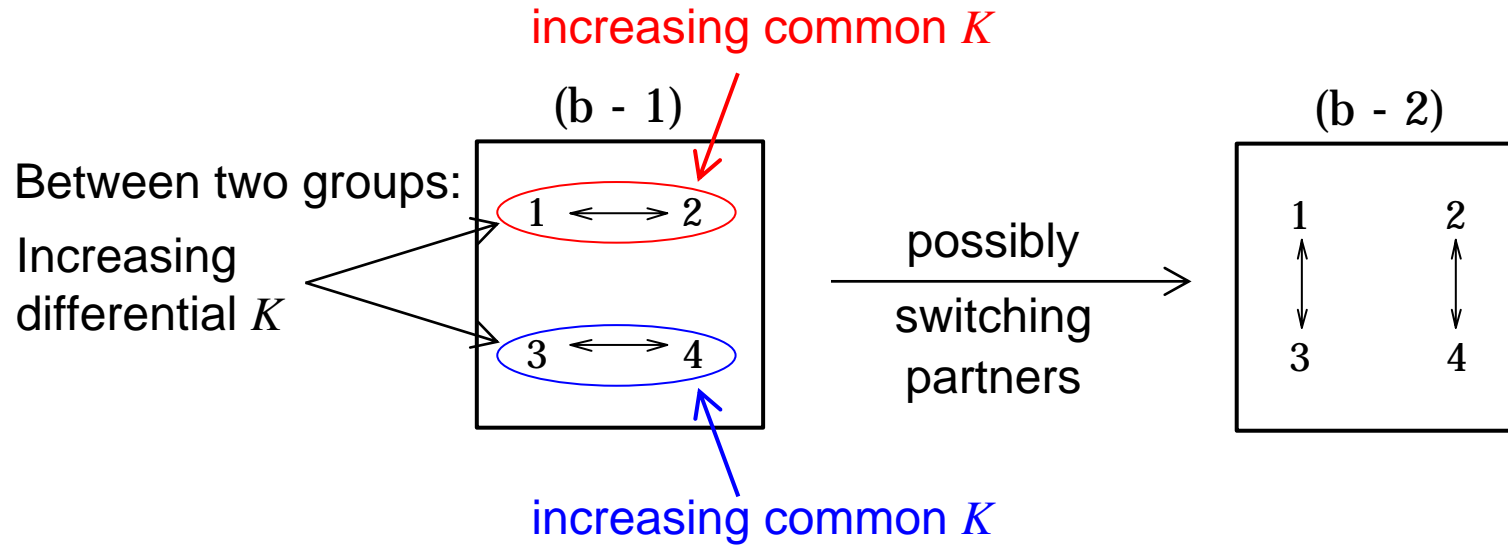

(c - 3)

quick
rotation

(d)

the 4-person case

a simple case when

$$= 0$$

K-transfer:

$$b_{ij} = \gamma [n_{ij}^d \cdot n_{ij}^c]^{1/2}$$

$$b_{ij} \equiv 0 : \text{no } K\text{-transfer}$$

The case with very sticky (tacit) knowledge
(only sharing the new ideas created jointly)

Example 1: Tokyo

Ota-ku

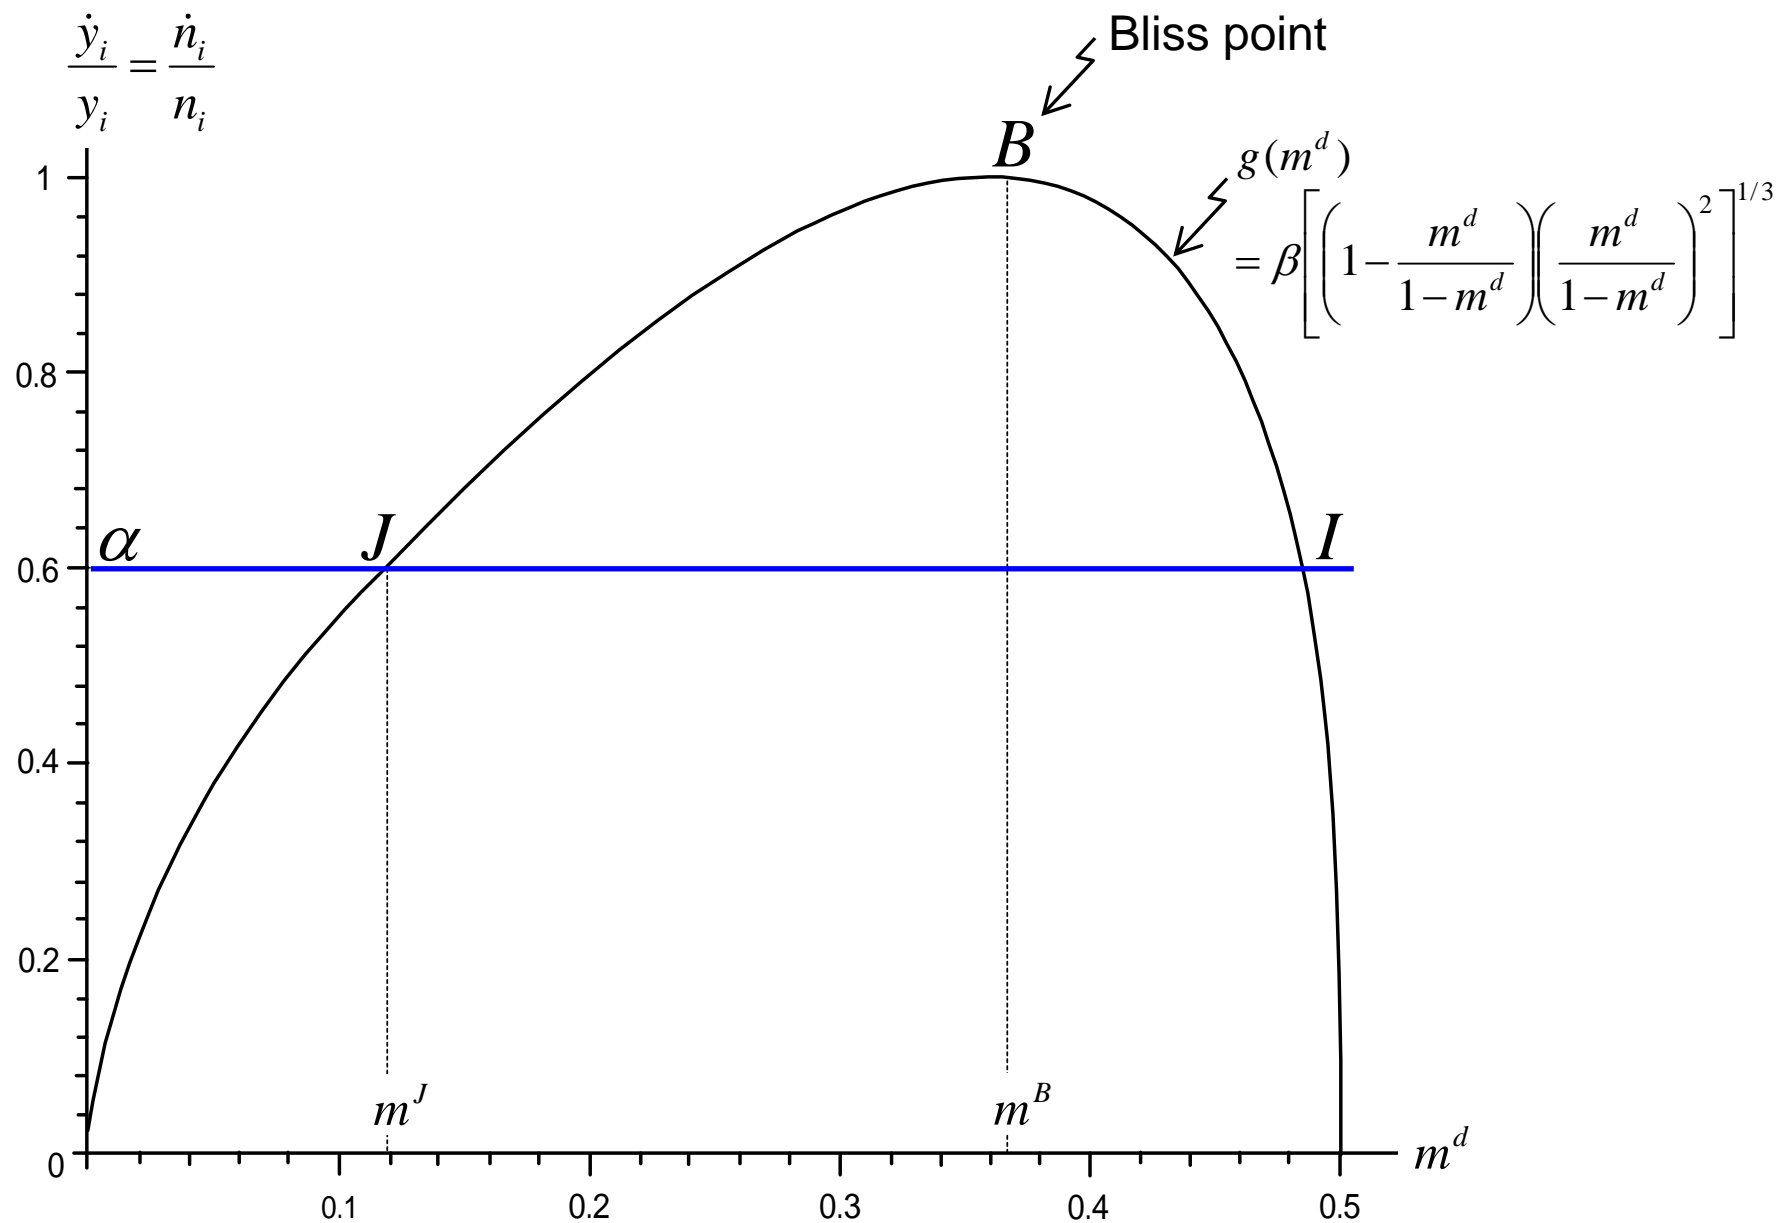

Osaka

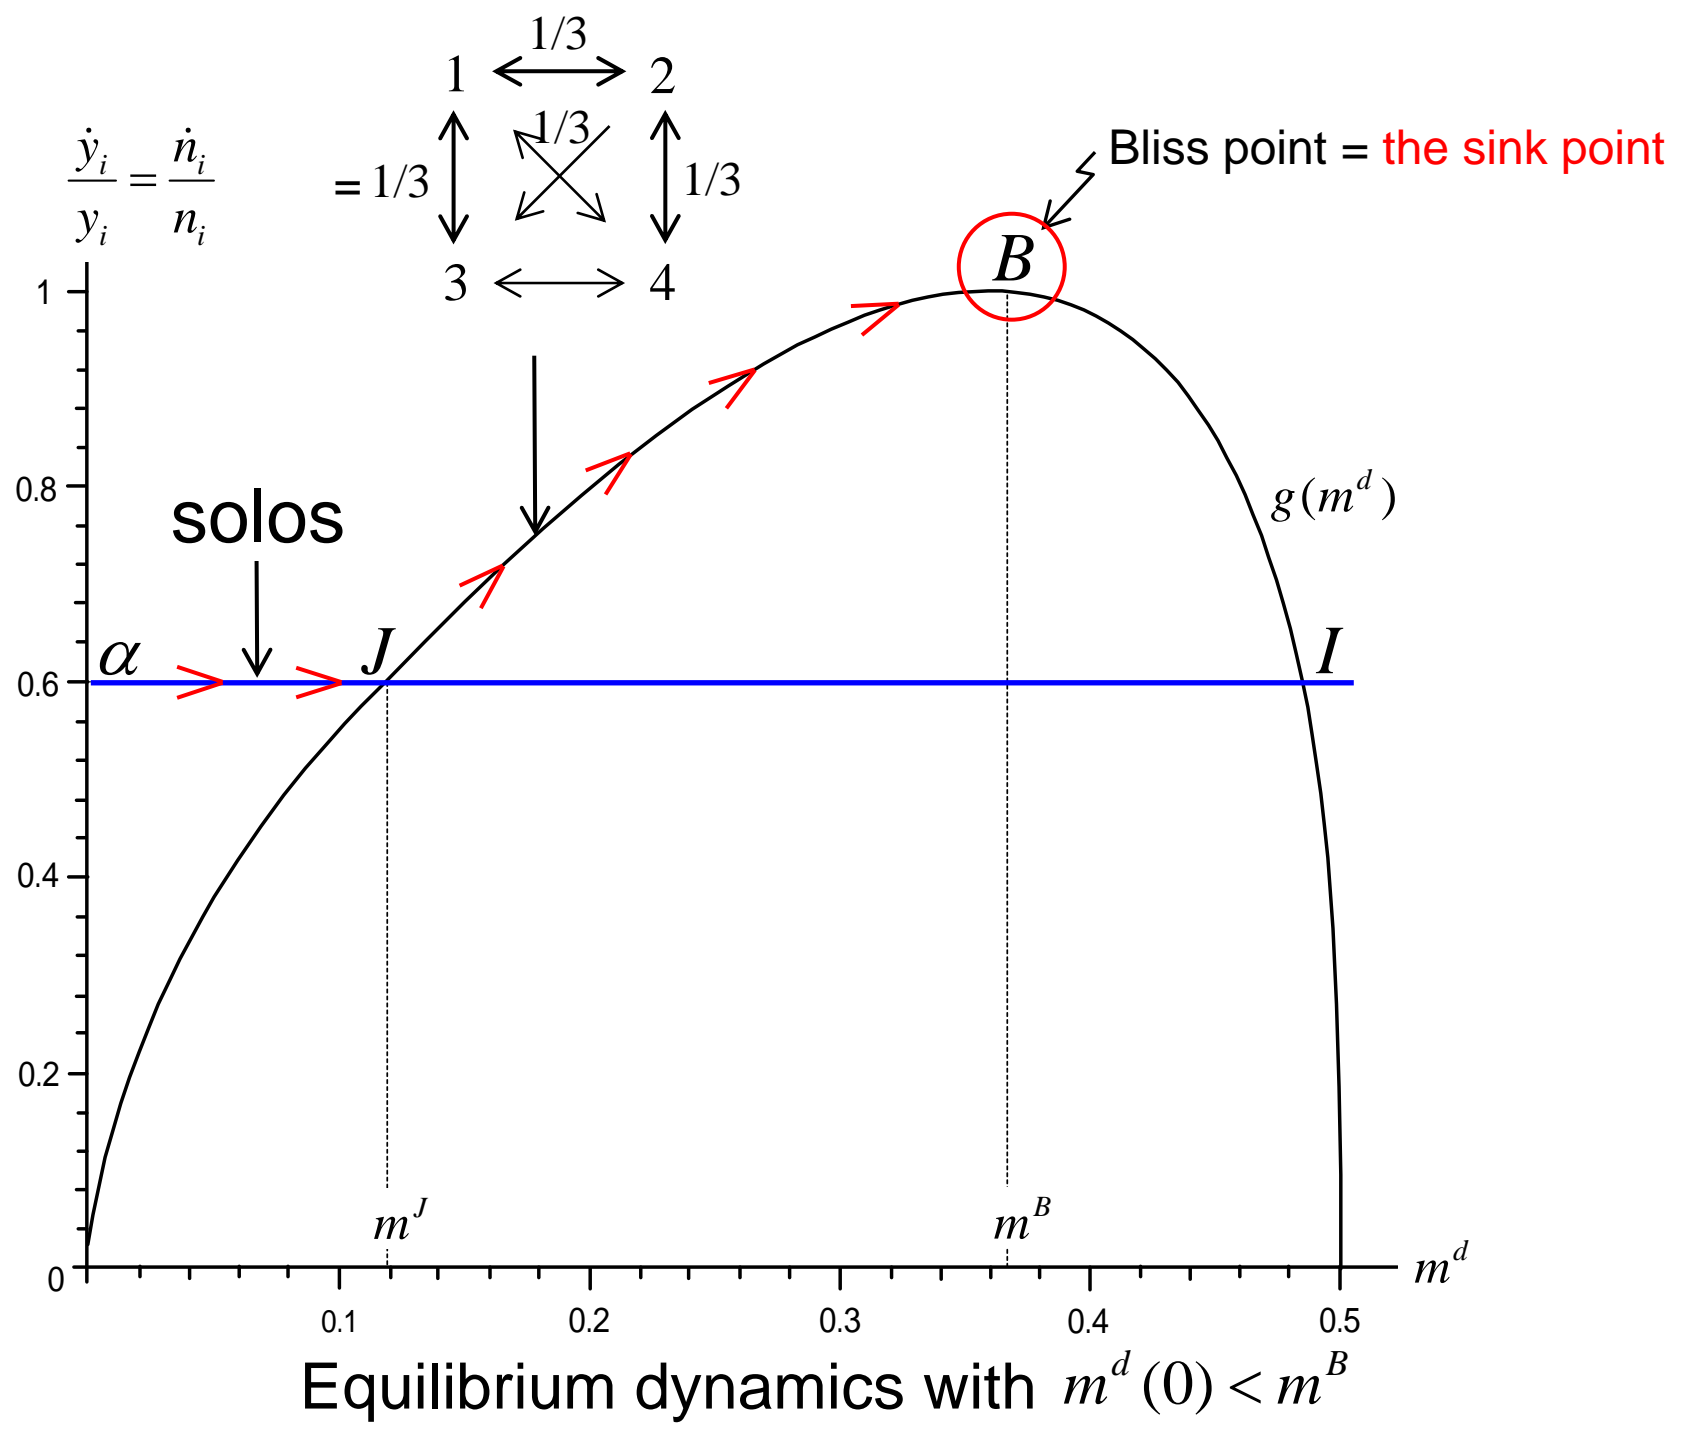

Higashi Osaka

many small firms (each with several workers)
each specialized in very specific manufacturing services

Example 2: The third Italy

Equilibrium dynamics with symmetric initial $m_{ij}^d(0) = m^d(0)$ for all $i \neq j$

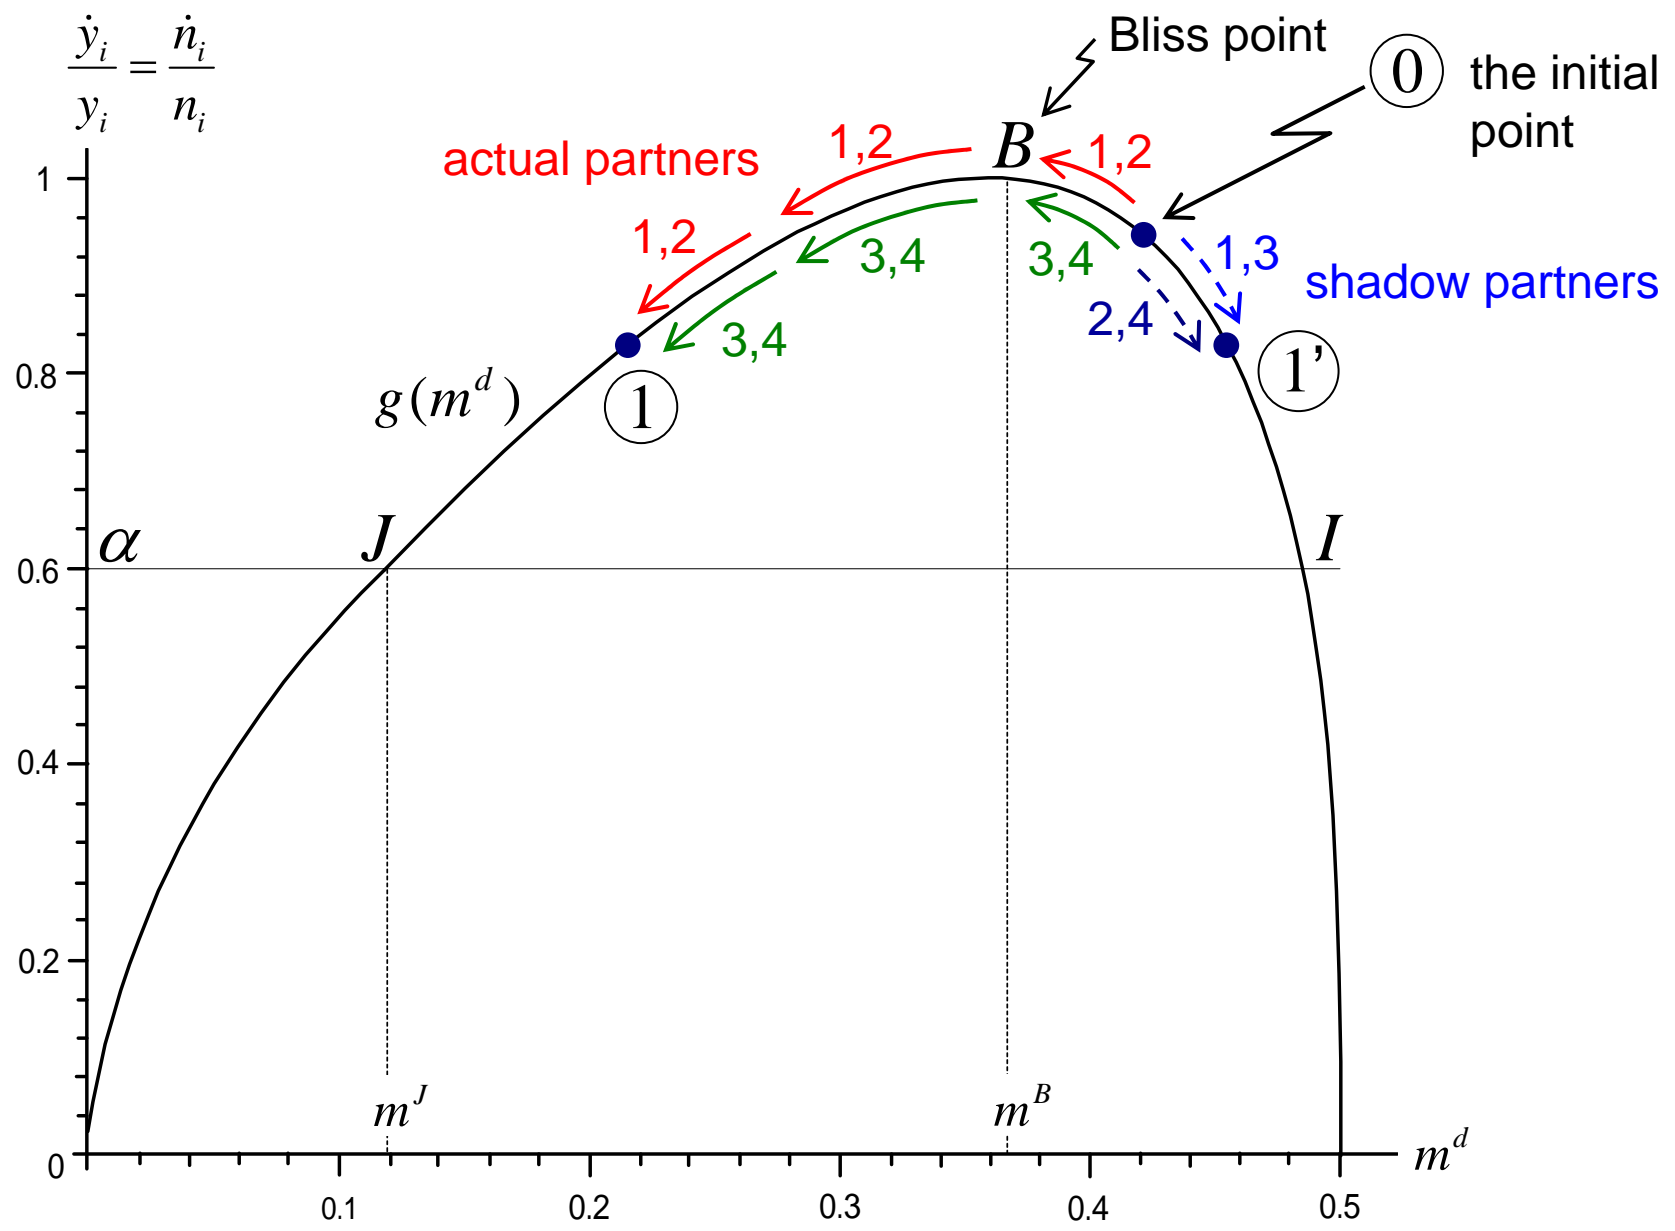

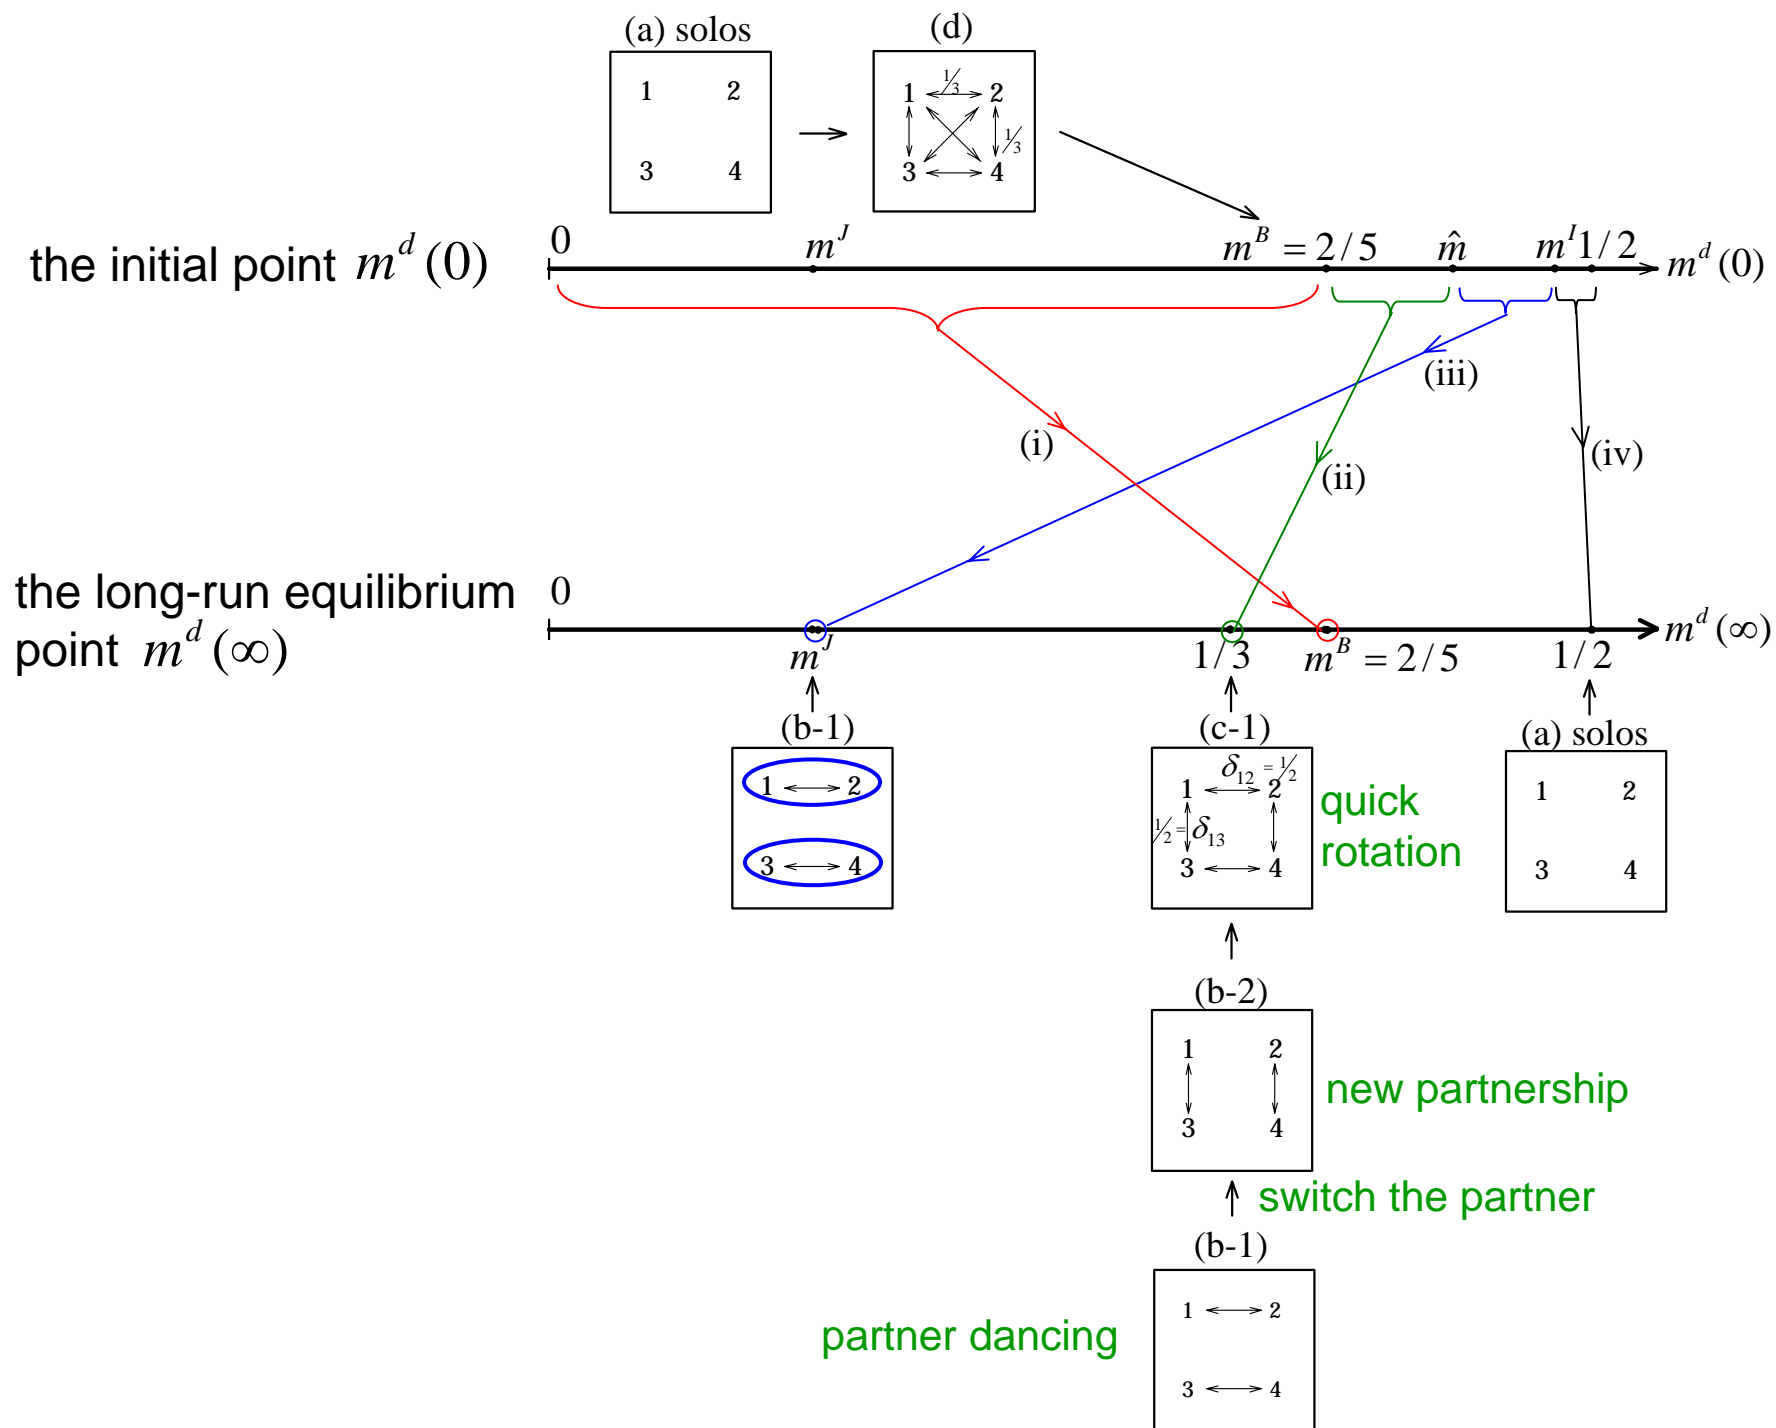

too heterogeneous initial state

dividing into two distinct groups

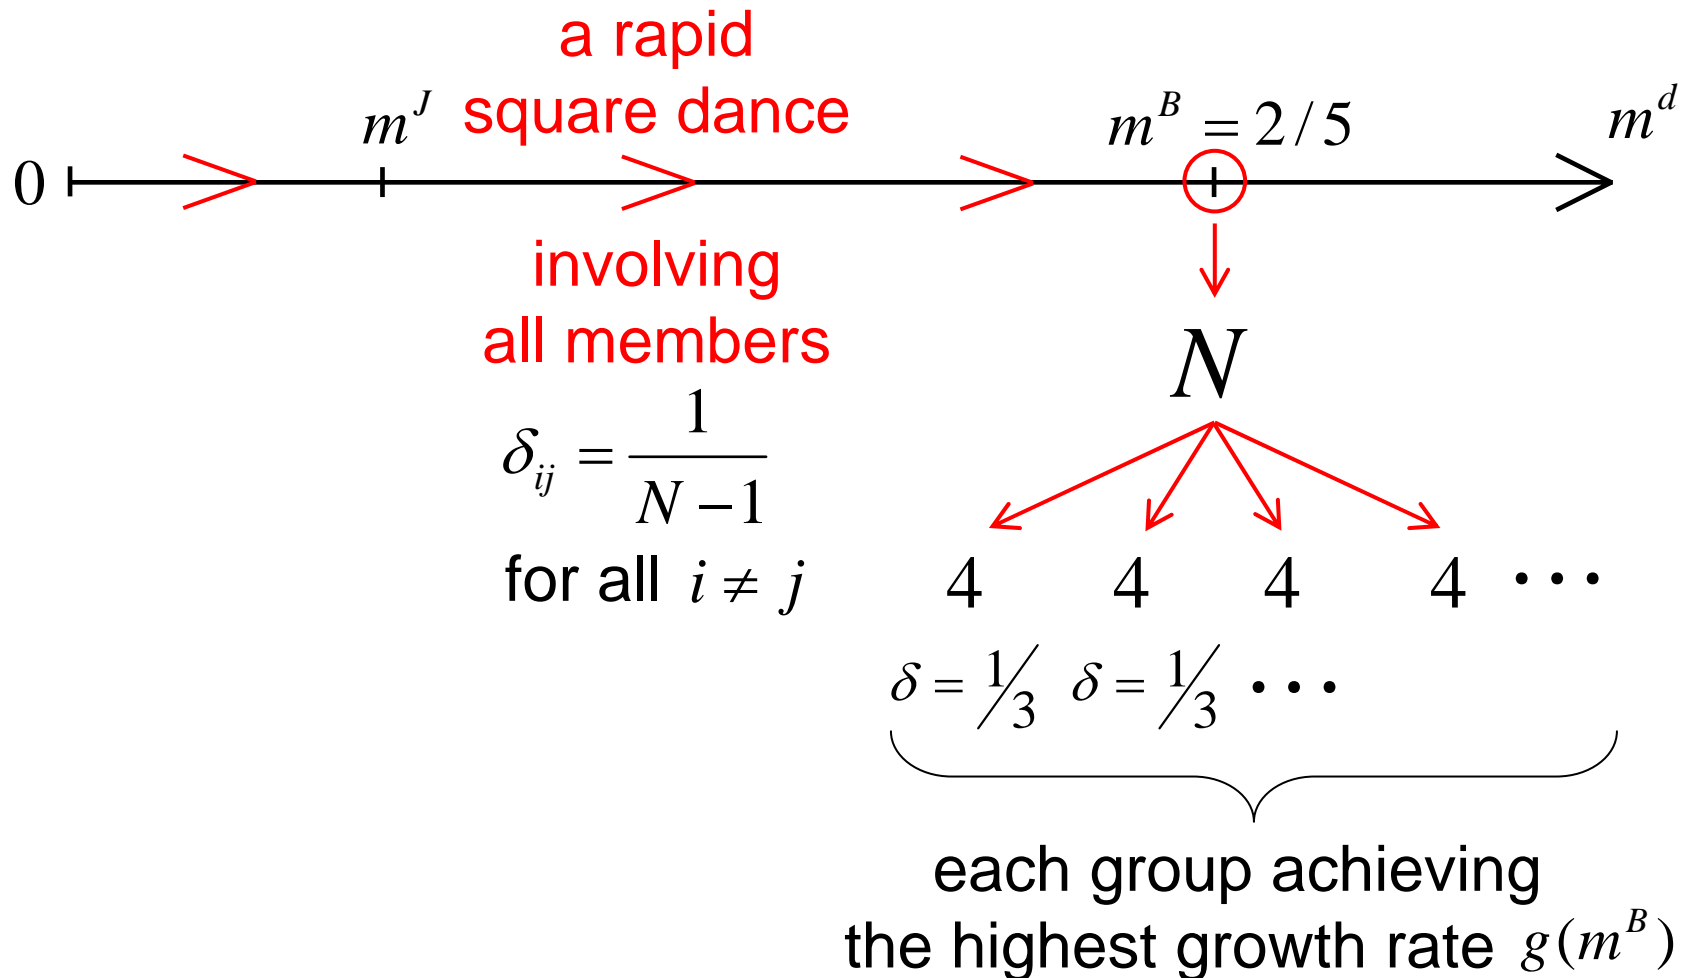

any $N = \text{a multiple of } 4$

essentially the same as 4-person case

why 4 ?

dividing into $N = 4$ at $m^B = \frac{2}{5}$ ← Bliss point

the fastest growth rate of K

Where does this magic number come from?

so far : $a_{ij} = \beta [n_{ij}^c \cdot n_{ij}^d \cdot n_{ji}^d]^{1/3}$

↓

the weight on the common knowledge

generalization : $a_{ij} = \beta (n_{ij}^c)^\theta (n_{ij}^d \cdot n_{ji}^d)^{\frac{1-\theta}{2}}$

↓

$$N^B = 1 + \frac{1}{\theta} \quad \text{at} \quad m^B = \frac{1-\theta}{2-\theta}$$

the size of partnership, achieving the fastest growth rate of K

$$a_{ij} = \beta(n_{ij}^c)^\theta (n_{ij}^d \cdot n_{ji}^d)^{\frac{1-\theta}{2}}$$

optimal group size $N^B(\theta)$

$i \leftarrow \text{“distance” } D \rightarrow j$

$$a_{ij} = \beta(D) [n_{ij}^c \cdot n_{ij}^d \cdot n_{ji}^d]^{1/3}$$

$$0 < D_1 < D_2 < \tilde{D}$$

$$M(0) \supset M(D_1) \supset M(D_2) \supset M(\tilde{D}) = \{m^B\}$$

$$m^*(0) < m^*(D_1) < m^*(D_2) < m^*(\tilde{D}) = m^B$$

$$\delta_{ij}^*(0) > \delta_{ij}^*(D_1) > \delta_{ij}^*(D_2) > \delta_{ij}^*(\tilde{D})$$

greater distance
 more selective for a partner
 with a greater K -heterogeneity

4-person case
with distance

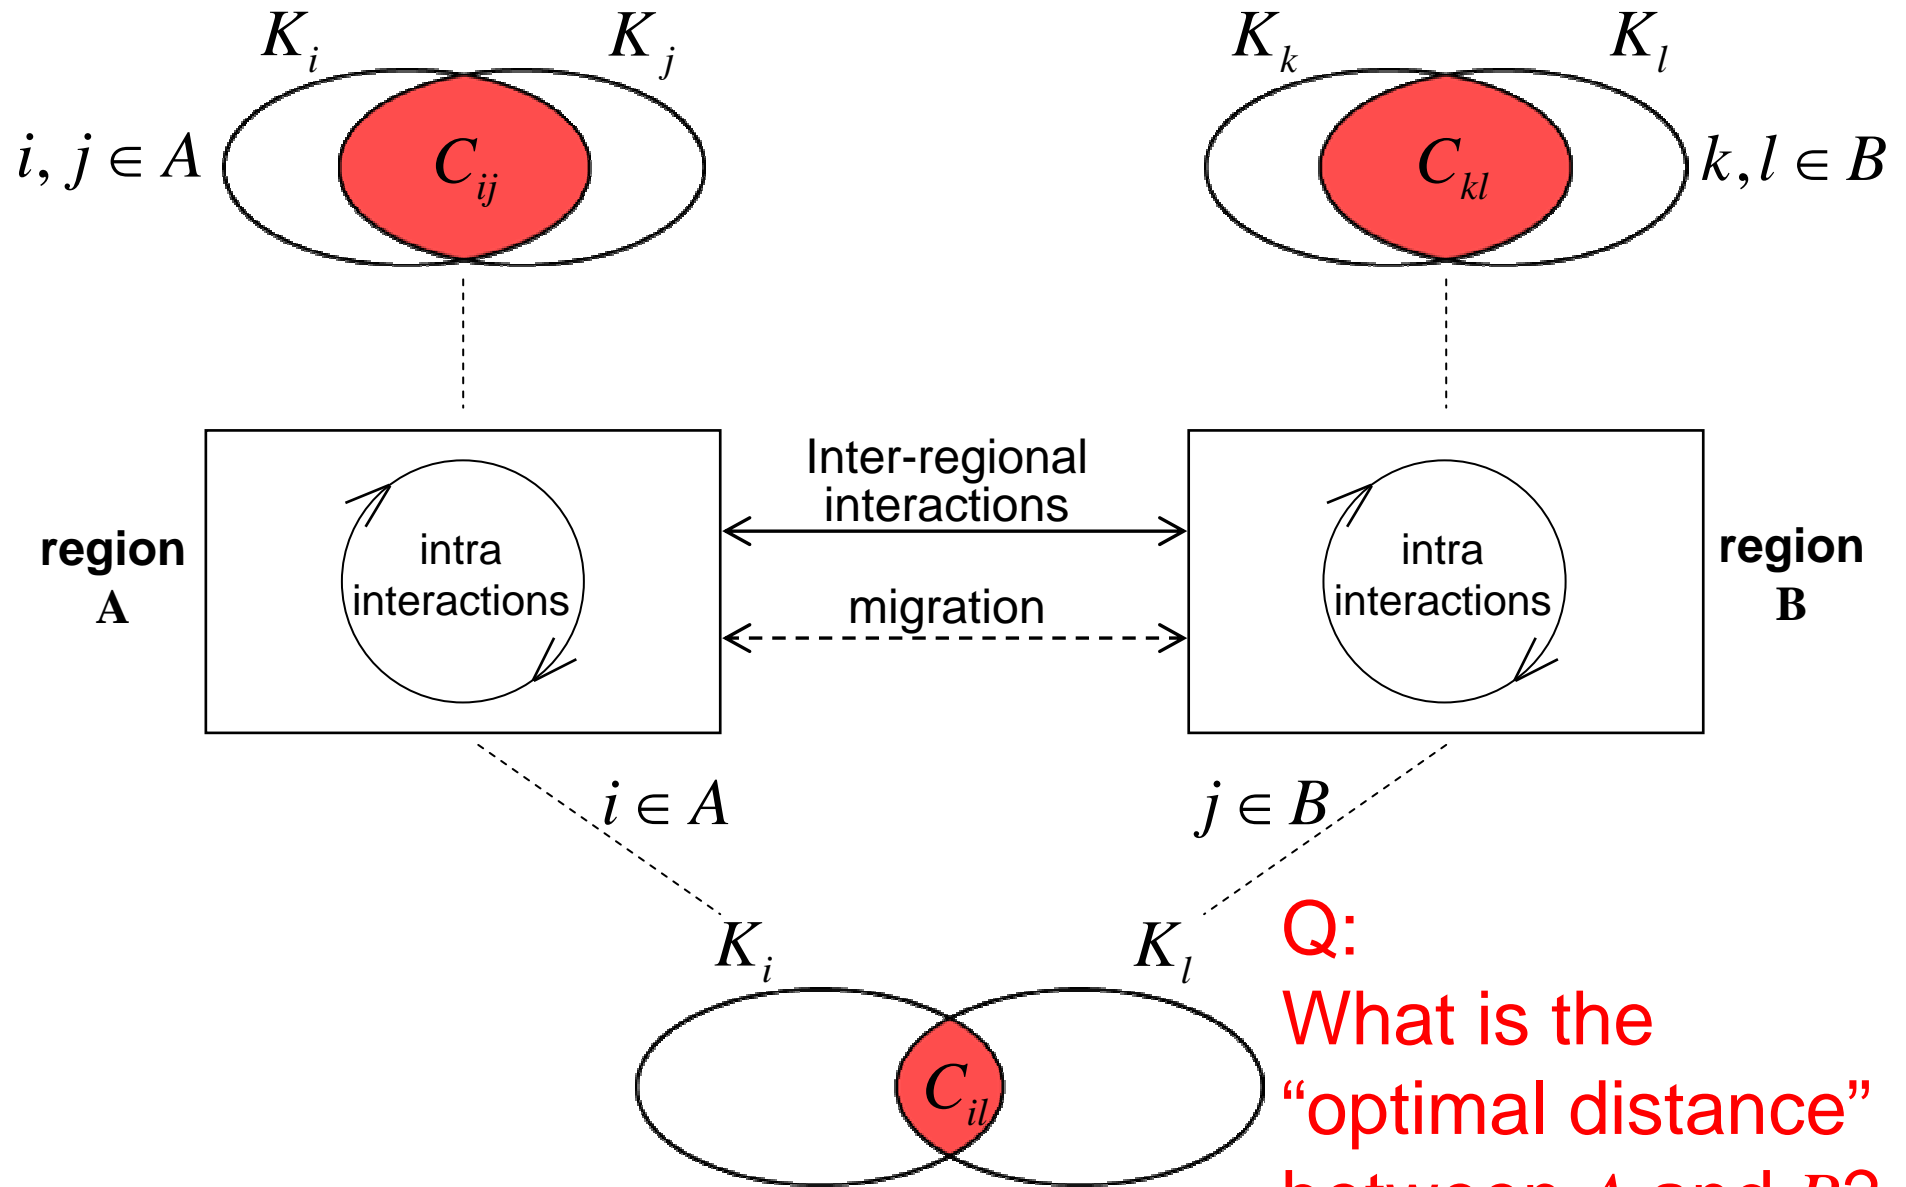

$$m_{ij}^d(0) = m^d(0)$$

for all $i \neq j$

Two-region case with many persons

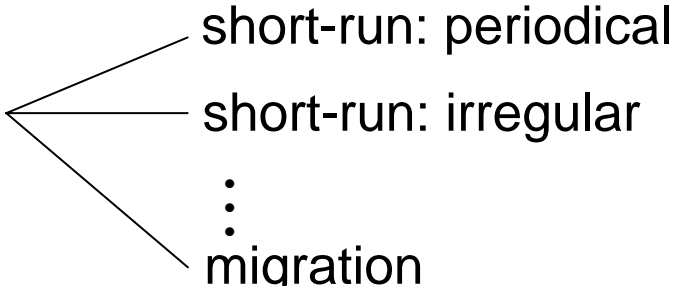

Q:
What is the
"optimal distance"
between A and B?

Possible Extensions / Tasks

1. multiple modes of K -transfer

2. multiple types of meeting

3. types of traveling 

4. knowledge structure

5. searching and stochastic modeling

⋮

X. Unifying the E-linkages and K-linkages in the spatial economy

Thanks
and
Sorry for overtime
